

EDUCAȚIA ȘI NOILE TEHNOLOGII

EDUCATION AND THE NEW TECHNOLOGIES

Mihai Aniței*

Abstract

The essential problem of education is the gap between the moment that education is offered, through the process of teaching, and the moment that the beneficiaries are required to put into practice the material that has been learned. The utilization of the new technologies aims to reduce this gap and to raise the efficiency of education. The article reviews the new technologies and discusses their impact on the educational field, thus offering a prospective view but also practical present applications with future consequences. The implications on professionals from the educational field are also discussed (the need for adaptation, the acquisition and restructuring of the teaching methods and skills).

Keywords: information technology, learning through technology, learning simulation through technology, web-based learning
